

```
function zoo() {  
  // Local variables of Zoo  
  var tiger = "zinda hai";  
  var lion = "zaroor marega";  
  
  function cage() {  
    // Using variables from outer scope  
    // Will be "captured" in a closure  
    console.log("tiger", tiger);  
  }  
  
  // local variables tiger and lion  
  // will be destroyed here  
  return cage;  
}  
  
// We get reference to inner function  
var pinjara = zoo();  
  
// Which we call and tiger is in the closure  
pinjara();
```
